

Quang Dang

(509) 213-2860 | Kent, WA | qp.dang6@outlook.com | LinkedIn

Professional Summary

Senior Software Engineer with 8+ years of experience designing and scaling distributed backend systems using Java, Spring Boot, AWS, and Kafka. Strong background in building event-driven, high-throughput platforms with a focus on low-latency APIs, data consistency, and resilient microservice architectures. Experienced in financial-grade data systems, multi-tenant architectures, and performance optimization across large-scale distributed environments.

Skills

- **Backend & Distributed Systems:** Java, Spring Boot, Microservices, REST APIs, Event-Driven Systems, Kafka, FIX Protocol, Concurrency, Distributed Systems, JVM Tuning, Quarkus
- **Cloud & Infrastructure:** AWS, Docker, Kubernetes, Terraform, CI/CD, Infrastructure Automation
- **Data Systems:** SQL, NoSQL, Data Modeling, Redis, PostgreSQL, MySQL
- **Engineering Practices:** System Design, Agile SDLC, Observability, Production Debugging, Performance Optimization, Reliability Engineering
- **Programming (Secondary):** Python, JavaScript, React (supporting services and tooling)

Work Experience

Senior Software Engineer New York, NY	Point.me	Jul 2023–Present
• Designed and implemented Java Spring Boot microservices on AWS to power high-volume search and transaction workflows, improving system throughput and maintaining sub-second API response times under heavy load. • Built Kafka-based event-driven pipelines to process real-time pricing and availability data, enabling scalable distributed orchestration across multiple backend services. • Optimized JVM performance and concurrency handling across Spring Boot services, reducing p95 latency by 50–70% through caching, partitioning, and asynchronous processing strategies. • Developed resilient REST APIs and AWS-based distributed services for transactional workflows, ensuring fault tolerance and consistency across multi-step booking operations. • Implemented internal operational systems using Spring Boot services and AWS infrastructure tooling, improving reliability and reducing manual operational overhead.		
Software Engineer New York, NY	Attentive	Jun 2021–Sep 2022
• Developed Java Spring Boot microservices on AWS supporting real-time messaging workflows, processing millions of events daily with high availability and reliability. • Designed Kafka-based streaming pipelines for event ingestion and customer segmentation, enabling near real-time personalization across distributed systems.		

- Improved concurrency handling and throughput in JVM-based services, optimizing Spring Boot APIs for high-volume, low-latency workloads.
- Built RESTful distributed services integrating AWS infrastructure components to support multi-tenant messaging orchestration systems.

Software Engineer

Epsilon

Jun 2018–Jun 2021

Chicago, IL

- Built Java Spring Boot microservices powering large-scale identity resolution systems on AWS, processing billions of records with high reliability and throughput.
- Developed Kafka-driven event pipelines for distributed data ingestion and normalization across multi-tenant enterprise systems.
- Optimized SQL and NoSQL data layers supporting high-volume identity matching and segmentation workloads, improving query performance by 45–55%.
- Implemented distributed REST APIs for data activation and audience delivery systems, ensuring scalable and fault-tolerant execution across AWS infrastructure.
- Enhanced system reliability through JVM tuning, concurrency optimization, and AWS-based scaling strategies in Spring Boot services.

Software Engineering Contractor

Pluri Inc

May 2017–Sep 2017

Tustin, CA

- Built Java-based backend services and REST APIs using Spring Boot for data processing and analytical workflows.
- Designed distributed processing pipelines supporting scalable ingestion and transformation of large datasets.
- Implemented SQL-based data models to support structured analytical queries and system performance optimization.
- Developed modular workflow orchestration components enabling reusable execution of backend processing pipelines.
- Collaborated with researchers to translate algorithmic requirements into scalable Java-based backend systems.

Education

Bachelor of Science in Computer Science

University of Illinois Urbana - Champaign

2014–2018
